Hi, Jan,

Please search amino acid sequences of SEQ ID NOs: 1, 4, 5, 6, 8 and 9 against commmerial <u>protein</u> databases for application 09880503 at least <u>50</u> printed results.

Very best,

Samue Liu AU 1653, REM 3C84 571-272-0949

submitted to the EMBL Data Library, May 1994
A; Description: Cloning and characterizatin of the bovine plasminogen cDNA:
A; Accession: $45046
A; Molecule type: mRNA
A; Residues: 17812 -6BEA
A; Molecule type: mRNA
A; Residues: 1812 -6BEA
A; Molecule to the EMBL: X79402; NID: 9494962; PIDN: CAA55939.1; PID: 9494963
A; Residues: 1 late and the matter of the metal of the initiator
A; Molecule to the manager muller, G.A.K.; Rosselet, S.J.; Kampfer Office it is uncertain whether Met-1 or Met-8 is the initiator
A; Molecule to manager muller, G.A.K.; Rosselet, S.J.; Kampfer D.; A; Rochem. 19, 267-278, 1985
A; Mittle: Complete amino acid sequence of bovine plasminogen. Comparison with R. A; Reference number: A25835; MUID: 95203906; PMID: 3846532
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                A; Accession: translated from GB/EMBL/DDBJ

APISAS
PAISAS
PASSANTA (EC 3.4.21.7) precursor - horse (fragments)
N'Alternate names: plasminogen
N'Scherins: miniplasminogen
C'Species: Equus caballus (domestic horse)
C'Species: Equus caballus (domestic horse)
C'Species: Equus caballus (domestic horse)
C'Accession: A61545, 817527
Exymeter (a.6. 6.6.6.) 1988
A.Title: Structural aspects of the plasminogen of various species.
Brizyme (40, 63.6.6), 1988
A.Title: Structural aspects of the plasminogen of various species.
A.Reference number: A61545, MUID: 89005015; PMID: 3168975

C'Comment: Plasminogen is converted into plasmin by plasminogen activators, bo mediately after talssociation from the clot. In the presence of the inhibitor, the activation involves also removal of the activation involves also removal of the activation peptide.
C'Comment: Stromelysin 1 (see PIR:KCMSS1) acts on plasminogen to produce angio cinuminose.
C'Punction:
C'Punction:
A'Description: dissolves the fibrin of blood clots; acts as a proteolytic fact in A'Description:
Biochemistry 30, 9781-9791, 1991

of two chains, A and B. The high molecular mass form contains a long chain A. Cleavage occurs after residue 155 in the low molecular mass form to yield a short Al chain.

-!- PHARMACEUTICAL: Available under the name Abbokinase (Abbott). Used in PULMOARTY Eablongs to peptidase family SI.
-!- SIMILARITY: Contains I EGF-like domain.

Submitted (DEC-1986) to the PIR data bank.
-!- CATALYTIC ACTIVITY: Specific cleavage of Arg-|-val bond in plasmingen to form plasmin.
-!- SIMILARITY: Belongs to peptidase family SI.
-!- SIMILARITY: Contains 1 EGP-like domain.
-!- SIMILARITY: Contains 1 kringle domain.

-!- SUBUNIT: Monomer.
-!- SIMILARITY: Belongs to peptidase family S1.
-!- SIMILARITY: Contains 1 EGP-like domain.
-!- SIMILARITY: Contains 1 kringle domain.

-!-CATALYTIC ACTIVITY: Specific cleavage of Arg-|-Val bond in plasminogen to form plasmin.
-!- ENZAME REGULATION: Activity toward plasminogen is stimulated in the presence of fibrin I.
-!- SUBUNIT: Monomer.
-!- DOWAIN: The fibronectin type-I domain mediates binding to fibrin, and the kringle domain apparently mediates fibrin-induced activity.
-!- SIMILARITY: Belongs to peptidase family S1.
-!- SIMILARITY: Contains I EGF-like domain.
-!- SIMILARITY: Contains I fibronectin type I domain.
-!- SIMILARITY: Contains I kringle domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               InterPro: JPR009003; Cys Ser trypsin. -!- CATALYTIC ACTIVITY: Specific cleavage of Arg-|-Val bond in plasminogen to form plasmin.
-!- SUBUNT: Monomer.
-!- SUBUNT: Monomer.
-!- SIMILARITY: Belongs to peptidase family S1.
-!- SIMILARITY: Contains 1 kringle domain.

```
-!- FUNCTION: Probably essential to support the feeding habits of this exclusively haematophagous animal. Potent thrombolytic agent.
-!- CATALYTIC ACTIVITY. Specific cleavage of Arg-|-Val bond in plasminogen to form plasmin paraminogen to form plasminogen is stimulated in the presence of fibrin I.
-!- ENZYME REGIZATION: Activity toward plasminogen is stimulated in the presence of fibrin I.
-!- SUBUNT: Monomer.
-!- DOWALN: The fibronectin type-I domain mediates binding to fibrin, and the kringle domain apparently mediates fibrin-induced stimulation of activity.
-!- SIMILARITY: Contains I EGF-like domain.
-!- SIMILARITY: Contains I EGF-like domain.
-!- SIMILARITY: Contains I kringle domain.
                                                                                                                                                                                                                                                                                                                                                                                                       This SWISS-PROT entry is copyright. TISSUE Extension of the bovine plasminogen activators upa many p., Berglund L., Petersen T.E.;

Tand tPA.";

Int. Dairy J. 5:605-617(1995).

T. FUNCTION: Converts the abundant, but inactive, zymogen plasminogen to plasmin by hydrolyzing a single Arg-Val bond in plasminogen. By controlling plasmin-mediated proteolysis, it plays an important role in tissue remodeling and degradation, in cell migration and many other physiopathological events.

C. --- CATALYTIC ACTIVITY: Specific cleavage of Arg-|-Val bond in plasminogen to form plasmin.

C. --- SUBUNIT: Heterodimer of chain A and chain B held by a disulfide

J. Biol. Chem. 276:15099-15106 (2001).

J. FUNCTION: Activates hepatocyte growth factor (HGF) by converting it from a single chain to a heterodimeric form (By similarity).

J. SUBGNIT: Dimer of a short chain and a long chain linked by a disulfide bond (By similarity).

J. SUBCELLIULAR LOCATION: Secreted as an inactive single-chain precursor and is then activated to a heterodimeric form (By cimilarity).

Transus monkey apolipopiocein(a). Sequence, evolution, and sites or synthesis."

5. Spid. Chem. 264:5957-5965(1989).

6. FONCTION: Apoli is the main constituent of lipoprotein(a) autoproteolysis. Inhibits tissue-type plasminogen activator 1.

1.p(a) may be a ligand for megalin/Gp 330.

1.p(a) may be a ligand for megalin/Gp 330.

2. SUBUNIT: Disulfide-linked to apo-B100. Binds to fibronectin and decorin (By similarity).

3. Subvated plasma concentrations of apo(a) and its naturally occurring proteolytic fragments are correlated with atherospenicity of the protein, because the tragment are competing with plasminogen kringles IV and V is naturally occurring proteolytic fragments are correlated with plasminogen kringles IV and V is naturally occurring proteolytic fragments are competing with plasminogen for fibrin(ogen) binding.

3. MSCELLANBOUS: Apo(a) is known to be proteolytically cleaved, leading to the formation of a promote thrombogenesis. Oglycosylation may limit the extent of proteolytic fragmentation (By similarity).

5. SIMILARITY: Belongs to peptidase family SI. Plasminogen subfamily.

6. SIMILARITY: Contains at least 10 kringle domains. This SWISS-PROT entry is copyright. It is produced through a collaboration between the Swiss Institute of Bioinformatics and the EMBL outstation the European Bioinformatics Institute. MORCHILA Cloning and characterization of Kremen, a novel

Kringle-containing transmembrane protein.";

Biochim. Biophys. Acta 1518:63-72(2001).

T. FUNCTION: Receptor for Dickkopf protein. (Coperates with Dickkopf to block Wart Deta-catenin signaling (By similarity).

T. SUBCELLULAR LOCATION: Type I membrane protein (Potential).

T. SIMILARITY: Contains I CUB domain.

T. SIMILARITY: Contains I Lange domain.

T. SIMILARITY: Contains I Kingle domain.

Submitted (JUL-2001) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: Receptor for Dickkopf protein. Cooperates with Dickkopf to block Wnt/beta-catenin signaling (By similarity).
-!- SUBCELJULAR LOCATION: Type I membrane protein (Potential).
-!- SIMILARITY: Contains 1 CUB domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Rattus norvegicus (Rat).

"Crystal structures of apolipoprotein(a) kringle IV37 free and complexed with 6-aminohexanoic acid and with p-aminomethylbenzoic J. Mol. Biol. 256:751-761(1996).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          FTM: N- and O-glycosylated. The N-glycans are complex biantennary structures present in either a mono- or disialylated state. The O-glycans are mostly (80%) represented by the monosialylated core type I structure, NeuMacalpha-36albetal-36alMac, with smaller amounts of disialylated and non-sialylated O-glycans also
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    MEDLINE=95002201; PubMed=7918682;

Biochim. Biophys. Acta 1227.445(1994).
-!- FUNCTION: Apo(a) is the main constituent of lipoprotein(a) (Lp(a)). It has sorine proteinase activity and is able of autoproteolysis. Inhibits tissue-type plasminogen activator 1.
Lp(a) may be a ligand for megalin/Gp 330.
-!- SUBUNIT: Disulfide-linked to apo-B100. Binds to fibronectin and

P08519;
```

DISEASE: Elevated plasma concentrations of apo(a) and its naturally occurring proteolytic fragments are correlated with atherosclerosis. Homology with plasminogem kringles IV and V is thought to underlie the atherogenicity of the protein, because the fragments are competing with plasminogen for fibrin(ogen) binding.

"Identification of the rat Heymann nephritis autoantigen (GP330) as a receptor site for plasminogen.";

"Identification of the rat Heymann nephritis autoantigen (GP330) as a proteolytic factor in a variety of other processes including embryonic development, tissue remodeling, tumor invasion, and inflammation; in ovulation it weakens the walls of the Graafian follicle. It activates the unxinase-type plasminogen activator, collagenases and several complement zymogens, such as CI and CS.

It cleaves fibrin, fibronectin, thrombospondin, laminin and von Willebrand factor.

C.-: CATALYTIC ACTIVITY: Preferential cleavage: Lys-|-Xaa > Arg-|-Xaa; higher selectivity than trypsin. Converts fibrin into soluble
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 206 SCYDDRDRGLSYRGMAGTTLSGAPCQSWAS----BATYWNVTAEQVLNWGLGDHAFCRNP 261

BNZYME REGULATION: Converted into plasmin by plasminogen activators, both plasminogen and its activator being bound to fibrin. Cannot be activated with screptokinase.

MISCELLANEOUS: Plasmin is inactivated by alpha-2-antiplasmin
BY SIMILARITY.

-!- FUNCTION: Plasmin dissolves the fibrin of blood clots and acts as a proteclytic factor in a variety of other processes including embryonic development, tissue remodeling, tumor invasion, and inflammation; in ovulation it weakens the walls of the Graafian follicle. It activates the urokinase-type plasminogen activator, collagenases and several complement zymogens, such activator, collagenases fibrin, fibronectin, thrombospondin, laminin and von Willebrand factor.

-!- CATALYTIC ACTIVITY: Preferential cleavage: Lys-|-xaa > Arg-|-xaa, hughers selectivity than trypsin. Converts fibrin into soluble
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             -!- BNZYME REGULATION: Converted into plasmin by plasminogen activators, both plasminogen and its activator being bound to fibrin. Cannot be activated with streptchinase.
-!- PTM: N-LINKED GLYCAN CONTAIN N-ACETYLLACTOSAMINE AND SIALIC ACID. D-LINKED GLYCANS CONSIST OF GAL-GALNAC DISACCHARIDE WITH IS MODIFIED WITH UP TO 2 SIALIC ACID RESIDUES (MICROHETEROGENEITY).
-!- MISCELLANEOUS: Plasmin is inactivated by alpha-2-antiplasmin immediately after dissociation from the clot.
-!- SIMILARITY: Belongs to opetidase family $1. Plasminogen subfamily.
-!- SIMILARITY: Contains 5 kringle domains.
                                                                                                                                                                                             SEQUENCE OF 706-812 FROM N.A.

EAVISIONS.
Lawn R.M.;
Submitted (FEB-1997) to the EMBL/GenBank/DDBJ databases.
-:- FUNCTION: Plasmin dissolves the fibrin of blood clots and acts as a protecolytic factor in a variety of other processes including embryonic development, tissue remodeling, tumor invasion, and inflammation; in ovulation it weakens the walls of the Graafian follicle. It activates the urokinase-type plasminogen activator; collagenases and several complement zymogens, such as C1 and C5. It cleaves fibrin, fibronectin, thrombospondin, laminin and von Willebrand factor.

CATALYTIC ACTIVITY: Preferential cleavage: Lys-|-Xaa, higher selectivity than trypsin. Converts fibrin into soluble

products.
-!- FUNTAR REGULATION: Converted into plasmin by plasminogen activators both plasminogen and its activator being bound to fibrin. Cannot be activated with streptokinase.
-!- MISCELLANBOUS: Plasmin is inactivated by alpha-2-antiplasmin immediately after dissociation from the clot.
-!- SIMILARITY: Belongs to peptidase family S1. Plasminogen subfamily.
-!- SIMILARITY: Contains 5 kringle domains.

RL Genet. 26:383-383 (2000).

1. FUNCTION: Tyrosine-protein kinase receptor which may be involved

1. In the early formation of the chondrocytes. It seems to be

1. required for cartilage and growth plate development.

1. CATALYTIC ACTIVITY: ATP + a protein tyrosine = ADP + protein

1. CATALYTIC ACTIVITY: ATP + a protein tyrosine = ADP + protein

1. SUBCELLULAR LOCATION: Type I membrane protein.
